Driving and environment

The first 1,000 miles (1,500 km) and afterwards

New engine

The engine needs to be run-in during the first 1,000 miles (1,500 km).

For the first 600 miles (1,000 kilometres):

- Do not use full throttle.
- Do not drive at engine speeds that are more than 2/3 of the maximimum permitted RPM.
- Avoid high engine speeds.

From 600 to 1,000 miles (1,000 to 1,500 kilometres):

- Speeds can *gradually* be increased to the maximum permissible road or engine speed.

During and after break-in period

- Do not rev the engine up to high speeds when it is cold. This applies whether the transmission is in N (Neutral) or in gear.

After the break-in period

- Do not exceed maximum engine speed under any circumstances.
- Upshift into the next higher gear *before* reaching the red area at the end of the tachometer scale ⇨ *page 10*.

During the first few hours of driving, the engine's internal friction is higher than later when all the moving parts have been broken in. How well this break-in process is done depends to a considerable extent on the way the vehicle is driven during the first 1,000 miles (1,500 kilometres).

Note

Extremely high engine speeds are automatically reduced. However, these RPM-limits were programmed for an engine well run-in, not a new engine.

For the sake of the environment

Do not drive with unnecessarily high engine speeds - upshifting early saves fuel, reduces noise and protects the environment.

New tires

If your vehicle is running on new tires, drive particularly careful for the first 350 miles (500 kilometres) after fitting.

WARNING

New tires tend to be slippery and must also be "broken-in". Be sure to remember this during the first 350 miles (500 kilometres). Brake gently. Avoid following closely behind other vehicles or other situations that might require sudden, hard braking.

New brake pads

Remember that new brake pads do not have a full braking effect during the first 250 miles (400 kilometres) after they are installed.

New brake pads have to be "burnished in" before they have optimal grab ⇨ ⚠.

During the break-in period, you should avoid putting severe loads on the brakes. Severe loads include, for example, sudden hard braking, in particular at very high speeds or, for example, on mountain passes.

WARNING

Until they develop the maximum "bite" for best stopping power, the surfaces on new brake pads require some "breaking-in" during the initial 100 to 150 miles (150 to 200 kilometres) of normal city driving. You can compensate for this by pressing the brake pedal more firmly. This applies whenever new pads are installed.

Avoid damaging the vehicle

When you are driving on poor roads, or over curbs, steep ramps, etc., make certain that low-lying parts such as spoilers and exhaust system parts do not bottom out and get damaged.

This is especially true for vehicles with low-slung chassis (sports chassis) and fully loaded vehicles.

Driving through water on roads

Note the following to avoid vehicle damage when driving through water, for example on flooded roads:

– The water must not be any higher than the bottom of the vehicle body.
– Do not drive faster than walking speed.

WARNING

After driving through water, mud, slush, etc., the brakes may be slow to take effect because of wet brake rotors and pads. Dry the brakes first by braking carefully to restore the full braking effect.

Note

Vehicle components such as the engine, transmission, suspension or electrical system can be severely damaged by driving through water.

Tips

– Check the depth of the water before driving through it.
– Do not stop the vehicle, drive in reverse or switch the engine off when driving through water.
– Keep in mind that oncoming vehicles may create waves that raise the water level and make it too deep for your vehicle to drive through safely.
– Avoid driving through salt water because it can cause corrosion.

Catalytic converter

It is very important that your emission control system (catalytic converter) is functioning properly to ensure that your vehicle is running in an environmentally sound manner.

- Always use lead-free gasoline ⇨ *page 178, Fuel supply*.
- Never run the tank down all the way to empty.
- Never put too much motor oil in your engine ⇨ *page 187, Adding engine oil*.
- Never try to push- or tow-start your vehicle.

The catalytic converter is an efficient "clean-up" device built into the exhaust system of the vehicle. The catalytic converter burns many of the pollutants in the exhaust gas before they are released into the atmosphere.

The exclusive use of unleaded fuel is critically important for the life of the catalytic converter and proper functioning of the engine.

WARNING

– Do not park or operate the vehicle in areas where the hot exhaust system may come in contact with dry grass, brush, fuel spill or other material which can cause a fire.
– Do not apply additional undercoating or rustproofing on or near the exhaust manifold, exhaust pipes, catalytic converter or heat shields. During driving, the substance used for undercoating could overheat and cause a fire.

Note

– Be aware that just one tank filling with **leaded** fuel will already seriously degrade the performance of the catalytic converter.
– Do not exceed the correct engine oil level ⇨ *page 187*.
– Do not drive until the fuel tank becomes completely empty. The engine could misfire. Unburned fuel could also get into ▶
